

PCT COOPERATION TREATY

PCT

NOTIFICATION OF ELECTION

(PCT Rule 61.2)

From the INTERNATIONAL BUREAU

To:

Assistant Commissioner for Patents
United States Patent and Trademark
Office
Box PCT
Washington, D.C.20231
ÉTATS-UNIS D'AMÉRIQUE

in its capacity as elected Office

Date of mailing (day/month/year) 01 March 2000 (01.03.00)	
International application No. PCT/DK99/00404	Applicant's or agent's file reference P199800232 wo
International filing date (day/month/year) 15 July 1999 (15.07.99)	Priority date (day/month/year) 16 July 1998 (16.07.98)
Applicant BENTZON, Michael, Deleuran	

1. The designated Office is hereby notified of its election made:

☒ in the demand filed with the International Preliminary Examining Authority on:

13 January 2000 (13.01.00)

☐ in a notice effecting later election filed with the International Bureau on:2. The election ☒ was☐ was not

made before the expiration of 19 months from the priority date or, where Rule 32 applies, within the time limit under Rule 32.2(b).

PCT

INTERNATIONAL SEARCH REPORT

(PCT Article 18 and Rules 43 and 44)

Applicant's or agent's file reference P199800232 wo	FOR FURTHER ACTION see Notification of Transmittal of International Search Report (Form PCT/ISA/220) as well as, where applicable, item 5 below.	
International application No. PCT/DK 99/ 00404	International filing date (day/month/year) 15/07/1999	(Earliest) Priority Date (day/month/year) 16/07/1998
Applicant NORDIC SUPERCONDUCTOR TECHNOLOGIES A/S et al.		

This International Search Report has been prepared by this International Searching Authority and is transmitted to the applicant according to Article 18. A copy is being transmitted to the International Bureau.

This International Search Report consists of a total of 3 sheets.

It is also accompanied by a copy of each prior art document cited in this report.

1. Basis of the report

- a. With regard to the **language**, the international search was carried out on the basis of the international application in the language in which it was filed, unless otherwise indicated under this item.

the international search was carried out on the basis of a translation of the international application furnished to this Authority (Rule 23.1(b)).

- b. With regard to any **nucleotide and/or amino acid sequence** disclosed in the international application, the international search was carried out on the basis of the sequence listing :

contained in the international application in written form.

filed together with the international application in computer readable form.

furnished subsequently to this Authority in written form.

furnished subsequently to this Authority in computer readable form.

the statement that the subsequently furnished written sequence listing does not go beyond the disclosure in the international application as filed has been furnished.

the statement that the information recorded in computer readable form is identical to the written sequence listing has been furnished

2. ☐ **Certain claims were found unsearchable** (See Box I).

3. ☐ **Unity of invention is lacking** (see Box II).

4. With regard to the **title**,

the text is approved as submitted by the applicant.

the text has been established by this Authority to read as follows:

5. With regard to the **abstract**,

the text is approved as submitted by the applicant.

the text has been established, according to Rule 38.2(b), by this Authority as it appears in Box III. The applicant may, within one month from the date of mailing of this international search report, submit comments to this Authority.

6. The figure of the **drawings** to be published with the abstract is Figure No.

as suggested by the applicant.

because the applicant failed to suggest a figure.

because this figure better characterizes the invention.

1

None of the figures.

INTERNATIONAL SEARCH REPORT

International Application No.

PCT/JP 99/00404

A. CLASSIFICATION OF SUBJECT MATTER
IPC 7 G01R33/12

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHEDMinimum documentation searched (classification system followed by classification symbols)
IPC 7 G01R

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.

	-/--	

☒ Further documents are listed in the continuation of box C.☒ Patent family members are listed in annex.

* Special categories of cited documents :

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier document but published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

"&" document member of the same patent family

Applicant NORDIC SUPERCONDUCTOR TECHNOLOGIES A/S et al	

- The applicant is hereby notified of the date of receipt (except where the letters "NR" appear in the right-hand column) by the International Bureau of the priority document(s) relating to the earlier application(s) indicated below. Unless otherwise indicated by an asterisk appearing next to a date of receipt, or by the letters "NR", in the right-hand column, the priority document concerned was submitted or transmitted to the International Bureau in compliance with Rule 17.1(a) or (b).
- This updates and replaces any previously issued notification concerning submission or transmittal of priority documents.
- An **asterisk(*)** appearing next to a date of receipt, in the right-hand column, denotes a priority document submitted or transmitted to the International Bureau but not in compliance with Rule 17.1(a) or (b). In such a case, **the attention of the applicant is directed** to Rule 17.1(c) which provides that no designated Office may disregard the priority claim concerned before giving the applicant an opportunity, upon entry into the national phase, to furnish the priority document within a time limit which is reasonable under the circumstances.
- The **letters "NR"** appearing in the right-hand column denote a priority document which was not received by the International Bureau or which the applicant did not request the receiving Office to prepare and transmit to the International Bureau, as provided by Rule 17.1(a) or (b), respectively. In such a case, **the attention of the applicant is directed** to Rule 17.1(c) which provides that no designated Office may disregard the priority claim concerned before giving the applicant an opportunity, upon entry into the national phase, to furnish the priority document within a time limit which is reasonable under the circumstances.

Applicant's or agent's file reference P199800232 wo MHG		IMPORTANT NOTICE
International application No. PCT/DK99/00404	International filing date (day/month/year) 15 July 1999 (15.07.99)	Priority date (day/month/year) 16 July 1998 (16.07.98)
Applicant NORDIC SUPERCONDUCTOR TECHNOLOGIES A/S et al		

1. Notice is hereby given that the International Bureau has communicated, as provided in Article 20, the international application to the following designated Offices on the date indicated above as the date of mailing of this Notice:
AU,CN,EP,IL,JP,KP,KR,US

In accordance with Rule 47.1(c), third sentence, those Offices will accept the present Notice as conclusive evidence that the communication of the international application has duly taken place on the date of mailing indicated above and no copy of the international application is required to be furnished by the applicant to the designated Office(s).

2. The following designated Offices have waived the requirement for such a communication at this time:

AE,AL,AM,AP,AT,AZ,BA,BB,BG,BR,BY,CA,CH,CU,CZ,DE,DK,EA,EE,ES,FI,GB,GD,GE,GH,GM,HR,

SD,SE,SG,SI,SK,SL,TJ,TM,TR,TT,UA,UG,UZ,VN,YU,ZA,ZW

The communication will be made to those Offices only upon their request. Furthermore, those Offices do not require the applicant to furnish a copy of the international application (Rule 49.1(a-bis)).

3. Enclosed with this Notice is a copy of the international application as published by the International Bureau on
27 January 2000 (27.01.00) under No. WO 00/04397

REMINDER REGARDING CHAPTER II (Article 31(2)(a) and Rule 54.2)

If the applicant wishes to postpone entry into the national phase until 30 months (or later in some Offices) from the priority date, a demand for international preliminary examination must be filed with the competent International Preliminary Examining Authority before the expiration of 19 months from the priority date.

It is the applicant's sole responsibility to monitor the 19-month time limit.

Note that only an applicant who is a national or resident of a PCT Contracting State which is bound by Chapter II has the right to file a demand for international preliminary examination.

REMINDER REGARDING ENTRY INTO THE NATIONAL PHASE (Article 22 or 39(1))

If the applicant wishes to proceed with the international application in the national phase, he must, within 20 months or 30 months, or later in some Offices, perform the acts referred to therein before each designated or elected Office.

For further important information on the time limits and acts to be performed for entering the national phase, see the Annex to Form PCT/IB/301 (Notification of Receipt of Record Copy) and Volume II of the PCT Applicant's Guide.

INFORMATION CONCERNING ELECTED OFFICES NOTIFIED OF THEIR ELECTION

(PCT Rule 61.3)

From the INTERNATIONAL BUREAU

To:

HOFMAN-BANG A/S
Hans Bekkevolds Allé 7
DK-2900 Hellerup
DANEMARK

Date of mailing (day/month/year) 01 March 2000 (01.03.00)		
Applicant's or agent's file reference P199800232 wo <i>HHB</i>		IMPORTANT INFORMATION
International application No. PCT/DK99/00404	International filing date (day/month/year) 15 July 1999 (15.07.99)	Priority date (day/month/year) 16 July 1998 (16.07.98)
Applicant NORDIC SUPERCONDUCTOR TECHNOLOGIES A/S et al		

1. The applicant is hereby informed that the International Bureau has, according to Article 31(7), notified each of the following Offices of its election:

AP : GH, GM, KE, LS, MW, SD, SL, SZ, UG, ZW

EP : AT, BE, CH, CY, DE, DK, ES, FI, FR, GB, GR, IE, IT, LU, MC, NL, PT, SE

National : AU, BG, BR, CA, CN, CZ, DE, IL, JP, KP, KR, MN, NO, NZ, PL, RO, RU, SE, SK, US

2. The following Offices have waived the requirement for the notification of their election; the notification will be sent to them by the International Bureau only upon their request:

EA : AM, AZ, BY, KG, KZ, MD, RU, TJ, TM

OA : BF, BJ, CF, CG, CI, CM, GA, GN, GW, ML, MR, NE, SN, TD, TG

National : AE, AL, AM, AT, AZ, BA, BB, BY, CH, CU, DK, EE, ES, FI, GB, GD, GE, GH, GM, HR, HU, ID, IN, IS, KE, KG, KZ, LC, LK, LR, LS, LT, LU, LV, MD, MG, MK, MW, MX, PT, SD, SG, SI, SL, TJ, TM, TR, TT, UA, UG, UZ, VN, YU, ZA, ZW

3. The applicant is reminded that he must enter the "national phase" **before the expiration of 30 months from the priority date** before each of the Offices listed above. This must be done by paying the national fee(s) and furnishing, if prescribed, a translation of the international application (Article 39(1)(a)), as well as, where applicable, by furnishing a translation of any annexes of the international preliminary examination report (Article 36(3)(b) and Rule 74.1).

Some offices have fixed time limits expiring later than the above-mentioned time limit. For detailed information about the applicable time limits and the acts to be performed upon entry into the national phase before a particular Office, see Volume II of the PCT Applicant's Guide.

The entry into the European regional phase is postponed **until 31 months from the priority date** for all States designated for the purposes of obtaining a European patent.

Check-boxes reserved for designating States which have become party to the PCT after issuance of this sheet:

- ☐
- ☐

Precautionary Designation Statement: In addition to the designations made above, the applicant also makes under Rule 4.9(b) all other designations which would be permitted under the PCT except any designation(s) indicated in the Supplemental Box as being excluded from the scope of this statement. The applicant declares that those additional designations are subject to confirmation and that any designation which is not confirmed before the expiration of 15 months from the priority date is to be regarded as withdrawn by the applicant at the expiration of that time limit. (Confirmation of a designation consists of the filing of a notice specifying that designation and the payment of the designation and confirmation fees. Confirmation must reach the receiving Office within the 15-month time limit.)

Box No. VI PRIORITY CLAIM					<input type="checkbox"/> Further priority claims are indicated in the Supplemental Box.
Filing date of earlier application (day/month/year)	Number of earlier application	Where earlier application is:			
		national application: country	regional application: regional Office	international application: receiving Office	
item (1) 16 July 1998	PA 1998 00944	Denmark			
item (2) 11 September 1998	PA 1998 01148	Denmark			
item (3)					
<input type="checkbox"/> The receiving Office is requested to prepare and transmit to the International Bureau a certified copy of the earlier application(s) (only if the earlier application was filed with the Office which for the purposes of the present international application is the receiving Office) identified above as item(s):					
<i>* Where the earlier application is an ARIPO application, it is mandatory to indicate in the Supplemental Box at least one country party to the Paris Convention for the Protection of Industrial Property for which that earlier application was filed (Rule 4.10(b)(ii)). See Supplemental Box.</i>

Re Item V

Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

The invention relates to a method for determining the critical current for a superconducting conductor and to an apparatus for performing the method.

DE-A-24 31 505 = D1 is regarded as closest prior art against which claim 1 has been delimited. In the D1 method the conductor is conveyed through a varying external magnetic field while being in a superconducting state. As consequence, a shielding field is generated in the conductor which generates induced shielding currents reaching the value of the critical current. An external touchless measurement means detects the overall field from which the induced currents are derived.

The invention distinguishes therefrom by using the part of the resulting magnetic field which is out of phase with the external field as a basis for the determination of the critical current. This measure allows a better and more reliable determination.

DE-A-26 06 504 discusses the method of D1 using two axially spaced, external magnetic fields the direction of which being offset against each other. DE-A-19 717 283 discloses a respective method having two measurement means being differently arranged.

Conclusively, there is no incitation in the prior art to use the above mentioned out of phase portion so that the subject-matter of claim 1 and, respectively, that of claim 5 is based on an inventive step. The dependent claims 2 to 4 and 6 to 13 include all features of the independent claims they are referred to and involve likewise an inventive step.

(54) Title: A METHOD FOR THE DETERMINATION OF THE CRITICAL CURRENT FOR A CONDUCTOR INCLUDING SUPERCONDUCTING MATERIAL, AND AN APPARATUS FOR PERFORMING THE METHOD

(57) Abstract

The invention relates to a method for the determination of the critical current for a conductor including superconducting material. The conductor is brought into a superconducting state, and a varying external magnetic field is generated through which said conductor is conveyed. A first measurement means is used to carry out a first contact-free measurement of the resulting magnetic field that occurs as a consequence of the influence of said external magnetic field on the conductor. The part of the resulting magnetic field out of phase with the external magnetic field is determined, and the critical current of the conductor is determined on the basis thereof. The invention further relates to an apparatus for performing the method.

A method for the determination of the critical current for a conductor including superconducting material, and an apparatus for performing the method

5 The invention relates to the determination of the critical current for a conductor including superconducting material, and to an apparatus for performing the method.

10 Conductors comprising superconducting material have different uses, e.g. in connection with magnets, transformers, and as conductors for electrical power distribution. Superconducting material is advantageously used in conductors as the superconducting material can be
15 brought into a superconducting state enabling electrical energy to be transmitted with little energy loss. Reduced electrical power loss is also advantageous as it enables construction of e.g. transformers, magnets, and conductors with smaller dimensions compared to the use of
20 conventional conductors.

Conductors comprising superconducting material can be constructed as a single core conductor, but is often constructed as a number of filaments arranged to form a
25 multi-core conductor.

When a superconductor is brought into the superconduction state, e.g. by cooling, electrical power can be transmitted with little loss, as long as the current is
30 lower than the so-called critical current. The critical current, i.e. that current which the superconductor material is able to support without going into a normally conductive state, is a characteristic value of the given superconductor. It is of great importance to determine
35 the critical current for a conductor comprising

superconducting material, as the value of the critical current is needed when dimensioning e.g. a transformer including superconductors.

5 As the value of the critical current may vary along the conductor, it is of interest to determine the critical current along the superconductor in order to characterize the superconductor. It is of interest to perform the
10 characterization of the conductor as a contact-less measurement as it enables a continuous determination of the critical current for a conductor over the entire length of the conductor. In addition, the contact-less measurement has the advantage of saving the conductor and the measurement means from wear due to mechanical
15 contact.

A method and an apparatus for testing a conductor which consists at least partially of superconductive material is disclosed in US patent 3,976,934. The patent teaches
20 that the testing of a conductor with superconductive material in the superconducting state can be performed by moving the conductor through an external magnetic field which induces shielding currents in the superconductor material and by measuring the magnetic field generated by
25 these shielding currents. The critical current is determined using the measured shielding field.

The object of the invention is to provide a method for the determination of the critical current for a conductor
30 including superconducting material, which method gives a better and more reliable determination than methods according to the prior art.

This object is achieved by performing the method as
35 stated in the characterizing portion of claim 1.

According to the invention, the determination of the critical current for a conductor including superconducting material is performed using a method, wherein said conductor is brought into a superconducting state, and wherein a varying external magnetic field is generated, through which said conductor is conveyed, and wherein a first measurement means is used to carry out a first contact-free measurement of the resulting magnetic field that occurs as a consequence of the influence of the conductor by said external magnetic field. The part of the resulting magnetic field out of phase with the external magnetic field is determined, and the critical current of the conductor is determined on the basis thereof.

The method according to the invention is advantageous as it uses a so-called coupling of the filaments in a conductor having a multi-filament structure to obtain a larger signal to noise ratio for the measured signal due to the fact that the measurement is performed on all the filaments in the conductor. The resulting magnetic field is larger when the filaments are coupled, as each filament hereby contributes constructively to the generation of the resulting magnetic field.

The method according to the invention is advantageous over prior art methods in which the resulting magnetic field, which reflects the value of the critical value, is relatively small due to field suppression. Due to field suppression, that the superconducting characteristics of a superconductor are reduced when exposed to a external magnetic field. Field suppression results in a relatively small magnetic field which reflect the critical current which provides a relatively small signal to noise ratio in the measured signal.

Using a method according to the prior art, it is difficult to obtain an optimum magnetic field in practice as both a too small and a too large external magnetic field result in a magnetic field which is lower than the optimum magnetic field. An optimum external field, when using a method according to the prior art, is a field that is large enough to induce shielding currents in the entire cross-section of the superconductor material to reach the critical current density. As the value of an optimum external value typically varies along the conductor, the measured magnetic field will therefore reflect this unwanted effect. These difficulties are avoided when using a method according to the invention as that part of the resulting magnetic field which is out of phase with the external magnetic field is used to determine the critical current.

In a preferred embodiment, a second measurement is carried out on the resulting magnetic field from another side in relation to the conductor by using a second measurement means. This second measurement is performed in addition to said first measurement of the resulting magnetic field from a first side in relation to the conductor. On the basis of these measurements, a more reliable result can be obtained. It also permits a supervision of the measurement. For example, it is possible to determine the distance between the conductor and the measurement means, and hereby to supervise the conveyance of the conductor, and it is possible to observe differences between the measurements of the different measurement means, which can e.g. be caused by ice on the measurement means.

In a preferred embodiment, compensation is made for measurement variations that occur as a consequence of

variations in distance between conductor and measurement means. This compensation is made on the basis of said first measurement, or any value derived therefrom, and on the basis of said second measurement, or any value derived therefrom.

It is particularly advantageous to perform said compensation by means of the formula $U = ((A+B) - k(A-B)^2) / 2$, wherein a corrected field value U is determined on the basis of the value A that is the field value from said first measurement or a value derived therefrom, and on the basis of the value B that is the field value of said second measurement or a value derived therefrom.

The invention also relates to an apparatus for the determination of the critical current for a conductor including a superconducting material adapted to perform the method according to the invention.

The apparatus comprises a conveyor arranged to convey the conductor through the apparatus, a cryostat arranged to cool the conductor to make it assume a superconducting state, a field generation device arranged to generate a varying magnetic field through which the conductor is conveyed, and a first measurement means arranged to carry out a measurement of the resulting magnetic field that occurs as a consequence of the influence of said magnetic field on said conductor. The apparatus further comprises means arranged to determine, on the basis of the measured magnetic field, that part which is out of phase with the resulting magnetic field, and on the basis of this to determine the critical current of the conductor.

In a preferred embodiment of the invention the field generating device comprises Helmholtz coils.

In a preferred embodiment, said first measurement means in the apparatus is arranged to carry out a measurement of the resulting magnetic field from a first side in relation to the conductor, and the apparatus further comprises a second measurement means arranged to carry out a measurement of the resulting magnetic field from another side in relation to the conductor. This is advantageous as the apparatus can be used to perform a more reliable measurement, and to supervise the measurement. Hereby it is possible to determine the distance between the conductor and the measurement means, and to supervise the conveyance of the conductor. By observing the measurements from the different measurement means, it is also possible to determine the differences, which e.g. can be caused by ice on the measurement means.

The apparatus advantageously comprises compensating means arranged to compensate, on the basis of measurements from said first and said second measurement means or values derived therefrom, for measurement variations due to the distance between conductor and measurement means.

Said compensating means is advantageously arranged to carry out said compensation by using the formula $U = ((A+B) - k(A-B)^2) / 2$, wherein a corrected field value U is determined on the basis of said measured field value A from said first measurement means or any value derived therefrom, and on the basis of the measured field value B from said second measurement means or any value derived therefrom.

In a preferred embodiment, said cryostat comprises a mechanical control device for controlling the conveyance of the conductor through the cryostat, and said cryostat

is arranged to contain a coolant for cooling the conductor.

In a preferred embodiment, the apparatus comprises two
5 separate guides between which the conductor is freely
suspended, and said field generating device and
measurement device are arranged between the two guides.
This is advantageous as the cryostat does not include any
movable parts. It is further advantageous as the cryostat
10 does not include components which could influence the
measurements.

Said control device advantageously comprises two slide
guides, which is advantageous due to the simple and
15 hereby sturdy construction.

In a preferred embodiment of the apparatus said guides
are made of high density polyethylene. This is advan-
tageous as this material can withstand the influence from
20 the environment.

The invention will be explained more fully by the
following description with reference to the drawing, in
which
25

fig. 1 is a side view of an apparatus according to the
present invention,

fig. 2 shows a section of the apparatus according to the
30 invention from a second side,

fig. 3 illustrates the coupling of filaments in a
conductor including superconducting material, and

35 fig. 4 illustrates the relationship between the shielding
field and the external magnetic field, and the

relationship between the remanent field and the external magnetic field.

Fig. 1 shows a preferred embodiment of an apparatus according to the invention. The cryostat containing the cooling medium 14 consists of a central vessel 9 and two tubes 7. A conductor 1 including superconducting material is conveyed from a coil 10 into the cryostat 7,9 through a field generating device 2, out of the cryostat and recoiled 11. The apparatus also comprises a mechanical control device which is designed to assure that the conductor movement in vertical and horizontal directions is restricted and that the conductor is not exposed to bending radius smaller than a given value, e.g. 200 mm. The field generating device 2, which is also called the magnet 2 hereinafter, may be constructed as a pair of Helmholtz coils. In the magnet 2 the field, B , is normal to the conductor surface and the field strength is advantageously high enough to obtain twice the field of full penetration for the actual superconductor. A first measurement means 5 and a second measurement means 6 are placed above and below the tape respectively. The measurement means 5,6, which are also called magnetic sensors 5,6 hereinafter, may e.g. be Hall probes, inductance coils, or superconducting circuits (squids).

The mechanical control device comprises two slide guides 3,4, which is advantageous due to the simple and hereby sturdy construction. The conductor is freely suspended between the two slide guides which are separated. The field generating device and the measurement device are arranged between the two guides. This is advantageous as the cryostat does not include any movable parts. It is further advantageous as the cryostat does not include components which could influence the performed measurements. The guides are made of high density

polyethylene, but can be made of other material if desired.

When the conductor 1 is conveyed through the apparatus,
5 by using a conveyor (not shown), the conductor is conveyed through the cooling medium 14 and is hereby brought into a superconducting state. The magnet 2 is adapted to generate a varying external magnetic field through which said conductor is conveyed. Hereby a
10 magnetic field is generated. A first contact-free measurement of the resulting magnetic field that occurs as a consequence of the influence of said external magnetic field on the conductor is carried out using the first measurement means 5. The resulting magnetic field
15 is also measured from another side in relation to the conductor using the second measurement means 6. It is advantageous to perform both the first and the second measurement, as they result in a more reliable measurement and make it possible to supervise the
20 measurement, e.g. to determine the distance between the conductor and the measurement means, and hereby to supervise the conveyance of the conductor. It is also advantageous as it permits observation of differences between the measurements of the different measurement
25 means 5,6, which can e.g. be caused by ice on the measurement means 5,6, or be caused by defects.

The resulting magnetic field is a sum of the external field and the field induced by the superconductor, i.e.
30 the so-called self-field. The self-field contains information about the superconducting properties of the tape. These properties are the critical current, the critical current distribution and density, distribution of induced superconducting and non-superconducting
35 currents, coupling of filaments, filament geometry, induced AC losses, field suppression, etc. All of these

properties will influence the amplitude and time dependence of the self-field. It is noted that the frequency of the varying external magnetic field is given a certain high value in order to ensure coupling of all the filaments in the conductor 1.

It is determined on the basis of the measurement which part of the resulting magnetic field is out of phase with the external magnetic field. The critical current is determined on the basis thereof. It is noted that the part of the measured magnetic field which is in phase and out of phase with the external field will be close to the shielding field and the remanent field respectively and are taken as the most important parameters describing the superconducting properties of the conductor 1.

On basis of the first measurement, or any value derived therefrom, and on the basis of said second measurement, or any value derived therefrom, a compensation is made for measurement variations that occur as a consequence of variations in distance between conductor 1 and measurement means 5,6. The compensation is e.g. performed by means of the formula $U = ((A+B) - k(A-B)^2) / 2$, wherein a corrected field value U is determined on the basis of the value A that is the field value from said first measurement or a value derived therefrom, and on the basis of the value B that is the field value of said second measurement or a value derived therefrom. It is noted, that k is a constant having a given value, e.g. 0.42.

The method according to the invention is advantageous as the coupling of the filaments in a conductor having a multi-filament structure provides a larger signal to noise ratio for the measured signal due to the fact that

the measurement is performed on all the filaments in the conductor simultaneously. The resulting magnetic field is larger when the filaments are coupled, which will be described in the following.

5

Fig. 2 shows a section of the apparatus of fig. 1 from a second side. The conveyer means 3 are designed to keep the tape steady in horizontal as well as vertical directions.

10

The conductor 1, which comprises superconducting material, is formed as a tape and includes a number of filaments 8 arranged to form a multi-core conductor. The conductor 1 is also called the tape 1 hereinafter, even though the conductor can also be formed in other ways.

15

Each filament 8 comprises superconducting material and is typically enclosed by another material e.g. silver, in order to give a flexible structure. Different types of superconducting materials are used, and can e.g. comprise Bismuth (Bi), Strontium (Sr), Calcium (Ca) and Copper (Cu) in a given ratio.

20

The filaments 8 in the tape 1 may be coupled due to the time derivative of the external magnetic field. The effect of coupling is that the filaments appear as one superconductor, and this is illustrated by the field lines 20 representing the lines from a single superconductor.

25

30

Fig. 3 illustrates the importance of filament coupling. The figure shows the field above two tapes where the filaments are not coupled (left) and where the filaments are coupled (right). Coupling of filaments increases with the time derivative of the field and with the conductivity of the matrix material. Coupling of the

35

filaments makes the superconducting currents couple together into one loop carrying the critical current. The magnetic field obtained by such a loop is much stronger than the field obtained by several loops. This is
5 illustrated in the figure by only two filaments. The effect increases with the number of filaments. When the filaments couple, the magnetic field is much bigger and more easy to measure and the relation between the measured field and the critical current is simple to
10 calculate by using Biot-Savart's law.

Fig. 4 illustrates the relationship between the shielding field and the external magnetic field, and the relationship between the remanent field and the external
15 magnetic field. The critical current carried by the superconductor depends on the amplitude of the external field. This is due to the field suppression. The remanent field will increase with the external field until saturation occurs around twice the field of full
20 penetration. Then the remanent field is saturated. The shielding field will start decreasing at higher fields due to the field suppression. The remanent field is advantageously measured when the external field is zero, while the shielding field is at its maximum value. The
25 remanent field will be a measure of the critical current at zero external field (self field).

It is further noted that the method also may be applied as follows:

30

- 1) The shielding field (the field set up by the SC being in phase with the external field) may be used to determine the critical current at the actual external field amplitude for fields exceeding the field of
35 full penetration.

2) A very reliable determination of the critical current in self field conditions is obtained by comparing the remanent field obtained at high external fields (at least twice the field of full penetration) to the shielding field obtained at low external field (e.g. 10% of the field off full penetration).

In the ratio $B_{\text{remanent}} \text{ (high field)} / B_{\text{shielding}} \text{ (low field)}$ the influence of geometrical variations (e.g. in the width or thickness of the SC) is cancelled out, and the ratio is therefore a more reliable image of the critical current at self field conditions.

Although a preferred embodiment of the present invention has been described and shown, the invention is not limited to it, but may also be embodied in other ways within the scope of the subject-matter defined in the appended claims.

20

P a t e n t C l a i m s :

1. A method for the determination of the critical current
5 for a conductor including superconducting material,
- wherein said conductor is brought into a
superconducting state,
- and wherein a varying external magnetic field is ge-
nerated through which said conductor is conveyed,
10 - and wherein a first measurement means is used to carry
out a first contact-free measurement of the resulting
magnetic field that occurs as a consequence of the
influence of said external magnetic field on the
conductor, c h a r a c t e r i z e d in that the part
15 of the resulting magnetic field out of phase with the
external magnetic field is determined, and that the
critical current of the conductor is determined on the
basis thereof.
- 20 2. A method according to claim 1, c h a r a c t e r -
i z e d in that in addition to said first measurement
of the resulting magnetic field from a first side in
relation to the conductor, a further, second measurement
of the resulting magnetic field is carried out from
25 another side in relation to the conductor using a second
measurement means.
3. A method according to claim 2, c h a r a c t e r -
i z e d in that on the basis of said first measurement,
30 or any value derived therefrom, and on the basis of said
second measurement, or any value derived therefrom,
compensation is made for measurement variations that
occur as a consequence of variations in distance between
conductor and measurement means.

4. A method according to claim 3, characterized in that said compensation is made by means of the formula $U = ((A+B) - k(A-B)^2) / 2$, wherein a corrected field value U is determined on the basis of the value A that is the field value from said first measurement or a value derived therefrom, and on the basis of the value B from that is the field value of said second measurement or a value derived therefrom.
- 10 5. An apparatus for the determination of the critical current for a conductor including a superconducting material, wherein said apparatus comprises
- a conveyor arranged to convey the conductor through the apparatus
 - 15 - a cryostat arranged to cool the conductor and to make it reach a superconducting state,
 - a field generation device arranged to generate a varying magnetic field through which the conductor is conveyed, and
 - 20 - a first measurement means arranged to carry out a measurement of the resulting magnetic field that occurs as a consequence of the influence of said magnetic field on said conductor,
- 25 characterized in that the apparatus further comprises means arranged to determine the part of the of the resulting magnetic field out of phase with the external magnetic field, and on the basis of this to determine the critical current of the conductor.
- 30 6. An apparatus according to claim 5, characterized in that the field generating device comprises Helmholtz coils.
- 35 7. An apparatus according to claim 5 or 6, characterized in that said first

measurement means is arranged to carry out a measurement of the resulting magnetic field from a first side in relation to the conductor, and that the apparatus further comprises a second measurement means arranged to carry out a measurement of the resulting magnetic field from another side in relation to the conductor.

8. An apparatus according to claim 7, characterized by further comprising compensating means arranged to compensate, on the basis of measurements from said first and said second measurement means or values derived therefrom, for measurement variations due to the distance between conductor and measurement means.

9. An apparatus according to claim 8, characterized in that said compensating means is arranged to carry out said compensation by using the formula $U = ((A+B) - k(A-B)^2) / 2$, wherein a corrected field value U is determined on the basis of said measured field value A from said first measurement means or any value derived therefrom, and on the basis of the measured field value B from said second measurement means or any value derived therefrom.

10. An apparatus according to one or more of claims 5-9, characterized in that said cryostat comprises a mechanical control device for controlling the conveyance of the conductor through the cryostat, and that said cryostat is arranged to contain a coolant for cooling the conductor.

11. An apparatus according to claim 10, characterized in that said control device comprises two separate guides between which the conductor

is freely suspended, and that said field generating device and measurement device are arranged between the two guides.

5 12. An apparatus according to claim 10 or 11, characterized in that said control device comprises two slide guides.

10 13. An apparatus according to claim 12, characterized in that said guides are made of high density polyethylene.
